Amendments to the Claims

This listing of claims supersedes all listing of claims.

In the Claims

Please amend the claims as follows:

(Currently amended) In a wireless data communications system wherein mobile
units communicate with a computer using access points, and wherein said system
operates according to a protocol specifying a format for data message packets and said
data message packets contain state information for said mobile units, a method for
detecting unauthorized access attempts to the system, comprising:

forwarding one or more data packets received by said access points to a computer, said state table on said computer, said state table storing state information for said mobile units, the state information including at least a MAC address parameter, an authentication status parameter, and a further parameter unrelated to the MAC address parameter and the authentication status parameter and maintaining a state transition history for each of said mobile units; and

operating said computer to compare format and state information of said one or more received data packets to selected requirements of said protocol-specified format and said stored state information, and signaling an alert if said packets deviate from said protocol-specified format or said stored state information.

- (Original) A method as specified in claim 1 wherein said protocol-specified format includes a header message and wherein said comparing of format comprises comparing format of said header message portion to said protocol-specified format.
- (Canceled)
- 4. (Previously presented) A method as specified in claim 2 wherein said protocol is a wireless protocol having a frame control field in said header message portion and wherein said comparing of format comprises comparing format of said frame control field

- (Previously presented) A method as specified in claim 1 wherein said one or more received data packets comprise Management Frames.
- (Previously presented) A method as specified in claim 1 wherein said one or more received data packets comprise Control Frames.
- (Previously presented) A method as specified in claim 1 wherein said one or more received data packets comprise a first WEP flag.
- (Previously presented) A method as specified in claim 7 wherein said packets have a first WEP flag value which is inconsistent with a second WEP value stored in said state table on said computer.
- (Previously presented) A method as specified in claim 1 wherein said one or more received data packets comprise a first Protocol Version value which is inconsistent with a second Protocol Version value stored in said state table on said computer.
- (Original) A method as specified in claim 1 wherein said one or more received data packets comprise a source MAC address which is a multicast address.
- 11. Original) A method as specified in claim 1 wherein said one or more received data packets comprise a source MAC address which is a broadcast address.
- 12. (Previously presented) A method as specified in claim 1 wherein said one or more received data packets comprise a first Power Management state variable which is inconsistent with a second Power Management state variable value stored in said state table on said computer.
- 13. (Previously presented) A method as specified in claim 1 wherein the step of

operating said computer further comprises checking a More Data field of said received data packets for a value of "1" and further monitoring said access points for a possible denial of service attack

- 14. (Previously presented) A method as specified in claim 1 wherein said one or more received data packets comprise an unsupported Type value.
- 15. (Previously presented) A method as specified in claim 1 wherein said one or more received data packets comprise an unsupported Type value.
- (Original) A method as specified in claim 1 wherein said one or more received data packets comprise a spoofed MAC address.
- 17. (Previously presented) A method as specified in claim 1 wherein said one or more received data packets comprise a frame of length which is inconsistent with said protocol-specified format.
- 18. (Canceled)
- 19. (Currently amended) In a wireless data communications system wherein mobile units communicate with a computer using access points, and wherein said system operates according to a protocol specifying a format for data message packets and said data message packets contain state information for said access points, a method for detecting unauthorized access attempts to the system, comprising:

forwarding one or more data packets received by said mobile units to a computer; $\mathbf{4}$

maintaining a state table on said computer, said state table storing state information for said access points, the state information including at least a MAC address parameter, an authentication status parameter, and a further parameter unrelated to the MAC address parameter and the authentication status parameter and maintaining a state transition history for each of said mobile units; and

operating said computer to compare format and state information of said one or more received data packets to selected requirements of said protocol-specified format and said stored state information, and signaling an alert if said packets deviate from said protocol-specified format or said stored state information.

- 20. (Original) A method as specified in claim 19 wherein said protocol-specified format includes a header message portion and wherein said comparing of format comprises comparing format of said header message portion to said protocol-specified format.
- 21. (Previously presented) A method specified in claim 20 wherein said protocol is a wireless protocol having a frame control field in said header message portion and wherein said comparing of format comprises comparing format of said frame control field.
- (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise Management Frames.
- (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise Control Frames.
- 24. (Canceled)
- (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise a first WEP flag.
- 26. (Previously presented) A method as specified in claim 25 wherein said packets have a first WEP flag value which is inconsistent with a second WEP value stored in said state table on said computer.

- 27. (Previously presented) A method as specified in claim 25 wherein said one or more received data packets comprise a first Protocol Version value which is inconsistent with a second Protocol Version value stored in said state table on said computer.
- (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise a source MAC address which is a multicast address.
- (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise a source MAC address which is a broadcast address.
- 30. (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise a first Power Management state variable which is inconsistent with a second Power Management state variable value stored in said state table on said computer.
- 31. (Previously presented) A method as specified in claim 19 wherein the step of operating said computer further comprises checking a More Data field of said received data packets for a value of "1" and further monitoring said access points for a possible denial of service attack.
- (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise an unsupported Type value.
- (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise an unsupported SubType value.
- 34. (Previously presented) A method as specified in claim 19 wherein said one or more received data packets comprise a spoofed MAC address.

more received data packets comprise a frame of length which is inconsistent with sai protocol-specified format.	
36.	(Canceled)
37.	(Canceled)
38.	(Canceled)
39.	(Canceled)
40.	(New) The method of Claim 1, wherein said further parameter is a power management mode.
41.	(New) The method of Claim 19, wherein said further parameter is a power management mode.

(Previously presented) A method as specified in claim 19 wherein said one or

35.
